APPROVED INTERNSHIPS AND RESIDENCIES IN THE UNITED STATES

ANNUAL REPORT ON INTERNSHIPS AND RESIDENCIES BY THE COUNCIL ON
MEDICAL EDUCATION AND HOSPITALS OF THE
AMERICAN MEDICAL ASSOCIATION

Edward H. Leveroos, M.D.; William R. Albus, M.D.; William W. Corbett, M.D., and William W. Southard, M.D.

In this issue the Council on Medical Education and Hospitals presents its annual report on graduate training. The official list of intern and residency programs includes data regarding hospitals approved as of April 1, 1950. Lists of additional programs approved will be published from time to time in subsequent issues of *THE JOURNAL*, including the Educational Number scheduled for publication Sept. 9, 1950.

Hospitals approved for intern training are listed by states together with data concerning the type of ownership or control, bed capacity, number of annual admissions, type of internship, length of service, number of positions offered by the hospital, affiliated assignments, outpatient service, autopsy rate and monthly stipend. It has been considered advisable to delete the column "Percentage of Service Cases" appearing in previous reports because of the difficulty in establishing a uniform basis for reporting this statistic; the type of control will ordinarily give sufficient information in this regard. Hospitals used as major teaching units or for limited assignments by junior or senior clerks have been identified with the medical schools with which they are affiliated. A résumé of the data appearing in the approval list is given in the textual material which follows.

Approved residencies are listed by states under each specialty and subspecialty. Information presented for each approved program includes the name of the chief of service as reported by the hospital, statistical data for the service, the total number of assistant residencies and residencies offered annually and the monthly stipend. In the following specialties, the program is listed as approved for a specified number of years: dermatology, neurologic surgery, neurology, obstetrics and gynecology, orthopedic surgery, pathology, pediatrics, psychiatry, surgery and urology. In these specialties, the American board concerned has indicated that it will give credit for the number of years listed in qualifying for its examination.

In a number of specialties, approval has been extended without designating the number of years for which the program is accredited. In these specialties the residents' training will be evaluated by the American board concerned on an individual basis, unless otherwise indicated. The length of the training program for which approval is extended in the medical specialties is ordinarily limited to one year.

The Council now extends official approval for residency training in concurrence with the following boards:

- American Board of Anesthesiology
- American Board of Dermatology and Syphilology
- American Board of Internal Medicine
- American Board of Neurological Surgery
- American Board of Obstetrics and Gynecology
- American Board of Orthopedic Surgery

- American Board of Otolaryngology
- American Board of Pathology
- American Board of Pediatrics
- American Board of Physical Medicine
- American Board of Plastic Surgery
- American Board of Proctology
- American Board of Psychiatry and Neurology
- American Board of Radiology
- American Board of Surgery
- Board of Thoracic Surgery
- American Board of Urology

Residencies in the medical subspecialties of allergy, cardiovascular, gastrointestinal and pulmonary diseases are presently approved in concurrence with the subspecialty board concerned. The Council also lists approved services in contagious diseases, general practice, malignant diseases and occupational medicine. A preliminary list of residencies in preventive medicine and public health is being prepared for publication in the 1951 Internship and Residency Number.

The publication of these lists is made possible through the assistance and cooperative effort of the hospitals conducting approved programs, the American boards mentioned previously, the federal services and the medical schools. The Council wishes to express its appreciation for their continued support and to make grateful acknowledgment of their contribution. The primary purpose of the report is to provide physicians with a source of information on graduate training which will be helpful to them in making their plans for intern and residency training. To this end, the following report is presented.

NUMBER OF INTERNSHIPS

The number of internships offered in hospitals approved by the Council has increased by 246 during the past year, in spite of a decrease in the number of approved hospitals. The trend during the past 10 years toward a greater increase in the number of internships as compared with the increase in the number of hospitals approved is reflected in table 1. Since 1940, the number of approved hospitals has increased by 9.1 per cent. During the same period, the number of internships offered has increased 17.1 per cent, or almost twice the increase which could have been expected, considering only the greater number of hospitals conducting intern training. In 1946, a postwar year, the number of hospitals which the Council had approved was almost exactly the same as approved this year, 798 in 1946 and 799 in 1950. None the less, virtually the same number of hospitals this year offer 1,372 more internships than were available four years ago. This trend toward greater demand for intern service in approved hospitals is a significant factor in considering the present shortage of interns.

Approved internships are now offered in all but four of the states (table 2). New York with 1,464 positions available, California with 897 and Pennsylvania with 837 lead in the number of internships. In addition to those available in the United States, there are 24 in the Canal Zone, 47 in approved hospitals in Hawaii and 29 in Puerto Rico.

INTERNSHIP VACANCIES

For the past two years, the percentage of internships which were vacant remained about constant, 20.5 per cent in 1948 and 19.7 per cent in 1949. This year the number of position vacancies has increased to 24.9 per cent of the total number offered. The number of vacancies reported by approved hospitals increased from 1,779 in 1949 to 2,340 in 1950. Part of this increase is due, of course, to the greater number of internships offered, 9,370 in 1950, as compared with 9,124 last year. Further, this year a greater number of hospitals gave complete information on their vacancies than the previous year. While data regarding the number of graduates of foreign medical schools serving in approved hospitals is not presently available, the number of these

TABLE 1.—Approved Hospitals, Internships and Medical School Graduates, 1940-1950

(U. S. Army, U. S. Navy Hospitals and those outside the United States not included in 1940 to 1947 figures.)

physicians seeking intern training must be taken into account, as well as graduates of medical schools in this country, when considering the disparity between the number of internships offered in approved hospitals and the number of interns available.

The percentage of internships reported vacant ranged from 0 in New Hampshire to 100 per cent in Mississippi. While hospitals in 11 states reported fewer vacancies than last year, 33 states and the District of Columbia reported an increase in the number of internships vacant. A comparative analysis of internship vacancies for the years 1949 and 1950 is presented in table 2, including, by states, the number of approved hospitals, the number of internships offered, the number of reported vacancies and the vacancy percentage.

In that part of the report which follows, the statistical data is based on information furnished by 96 per cent of the 799 hospitals approved. Accordingly, the totals referred to hereafter will vary from those given in the preceding paragraphs. Complete information regarding the length and type of internship offered, stipend and autopsy percentage was furnished by 762 hospitals of those approved.

TYPE OF INTERNSHIP AND CONTROL

Three types of internships are approved by the Council: rotating, mixed and straight. The Council considers that the rotating internship is most likely to provide

the best basic training for the graduate, whether he intends later to enter general practice or to take further training in a specialty. It provides for supervised experience in the major clinical divisions of internal medicine, surgery, obstetrics and pediatrics, together with training in anesthesiology, roentgenology and pathol-

experience in the major clinical divisions of internal medicine, surgery, obstetrics and pediatrics, together with training in anesthesiology, roentgenology and pathol-

ogy. The mixed internship offers training in two or more, but not all, of the major divisions. A straight internship is limited to supervised experience in a single major clinical division, including its related subspecialties. Approval in this category is extended in internal medicine, surgery, pediatrics, obstetrics and pathology. It is ordinarily limited to hospitals affiliated with medical schools where the intern's participation in the educational activities of the school compensates to a degree for the limited nature of his hospital training.

A breakdown of the type of internships available is given in table 3. The data is presented from the standpoint of hospital control in addition to type of internship offered. In the federal group 90.5 per cent of the internships are of the rotating type, 7.9 per cent straight and 1.6 per cent mixed. The hospitals classified as governmental (other than federal) reported 87.3 per cent of their internships were rotating, 10.7 per cent were straight and 2.0 per cent mixed. The breakdown for the nongovernment group was about the

LENGTH OF INTERNSHIP

It has been pointed out that a significant factor in the present shortage of interns has been the decrease in the number of 18 month and two year internships available, with a consequent increase in the annual demand for interns by hospitals which formerly offered appointments only on alternate years. In view of the fact that men in the intern age group are no longer being inducted into military service, permitting the hospitals more flexibility in long range planning, it might have been expected that a number of hospitals would return to their prewar schedules, offering 18 and 24 month training. Actually, the number of hospitals offering training of more than one year's duration remained almost constant during the past year. In 1949, 76 hospitals reported programs in excess of one year, while this year 77 hospitals reported programs of this type. There were 1,189 rotating, 132 straight and 82 mixed internships offered which were more than one year in length, constituting 15.6 per cent of

same, with 86.8 per cent of the rotating variety, 10.5 per cent straight and 2.7 per cent mixed. Considering all hospitals in these groups, 87.3 per cent of the internships were rotating in nature.

The federal services now provide 6.2 per cent of the internships offered by approved hospitals, with the Navy listing 208,¹ an increase of 19 over last year, the Army 154,¹ a decrease of 3 internships during the same period, and the Federal Security Agency hospitals, including those of the Public Health Service, 154, the same number as last year. For the first time the Council has listed Veterans Administration hospitals as approved for intern training; in the two hospitals approved as of April 1, 1950, 87 internships were being offered. Other governmental hospitals, (city, county and state) provide for 31.1 per cent of the internships in this table, including 1,300 in city hospitals, 713 county, 560 state and 224 internships in city-county hospitals. Internships in nongovernmental hospitals comprise 62.7 per cent of the total with nonprofit association hospitals offering 3,184, church-sponsored hospitals 2,405, corporation-owned hospitals 43 and hospitals conducted on a partnership basis 11.

1. Does not include internships in civilian hospitals sponsored by the service.

the total number approved in the reporting hospitals. Reorganization of the internship on a two year basis by 40 per cent of those hospitals presently approved would serve to reduce the number of interns required annually to approximately the number of interns available. The development of two year programs designed for the physician intending to enter general practice and the acceptance when feasible by the specialty boards of internship training at the second year level would serve to stimulate renewed interest in the longer training periods for the intern.

STIPENDS

Stipends offered in approved hospitals during the past year were somewhat higher than those of the previous year. A breakdown of the salaries paid in addition to maintenance shows 63 hospitals (9 per cent) paid no salaries to the intern staff; 293 hospitals (40 per cent) paid \$50 or less per month; 283 hospitals (39 per cent) offered amounts ranging from \$51 to \$100, and the other 89 (12 per cent) paid amounts in excess of \$100. The comparable percentages for 1949 were 13, 40, 33 and 9 per cent, respectively (in the remaining 5 per cent of hospitals, information regarding stipends was not submitted). During the past year

there was a decided decrease in the number of hospitals which offer no salary. Last year 104 hospitals reported that they paid no salary to the intern staff; this year the number so reporting had fallen to 63. On the other hand, the number of hospitals reporting salaries in excess of \$100 per month, rose from 71 in 1949 to 89 this year.

Stipends paid by the federal services are not listed. The intern serving in a federal hospital, or in a civilian hospital under the sponsorship of a federal service, receives pay and allowances as established by government pay tables. Stipends paid in Veterans Administration hospitals are based on salary levels prevailing in the area as established by the Veterans Administration in cooperation with the Deans Committee responsible for the training program.

† Number of residency programs in 1,079 hospitals approved for residency training.

APPROVED RESIDENCY PROGRAMS

The Council now lists approved residencies in 27 different branches of medicine, including 19 specialties in which certifying boards have been established and 5 which are considered subspecialties of a major clinical division; i. e., allergy, cardiovascular diseases, gastroenterology, pulmonary diseases and thoracic surgery. A résumé of specialties approved by the Council is presented in table 5. Information is given regarding the number of hospitals approved in the specialty, the number of residencies offered and the number of vacancies reported, as of Sept. 1, 1949.

Surgical residencies are listed in two categories: those approved by the Council and the American Board of Surgery, and a second group of hospitals, to which approval has been extended by the Council as offering satisfactory training in general surgery in preparation for residency training in the surgical specialties. An

editorial commenting on these two types of surgical programs appears in this issue ("Approved Surgical Programs," page 1216). Residencies in general practice are listed for the first time with 32 hospitals offering 94 residencies in this field. Also for the first time an approved program in occupational medicine is included in the list.

In eleven of the specialties, including dermatology and syphilology, neurologic surgery, neurology, obstetrics-gynecology, orthopedic surgery, pathology, pediatrics, psychiatry, radiology, surgery and urology, programs are listed as approved for a specified number of years of training.

Residencies in radiology are being reappraised on the basis of a survey recently completed. A revised list of residencies in this specialty will appear in the Educational Number, Sept. 9, 1950.

There are now 4,292 residency training programs being conducted in 1,079 hospitals approved by the Council. The specialties in which the greatest number of hospitals are approved include: surgery, 600 approved programs; internal medicine, 528; pathology, 417; radiology, 375, and obstetrics and gynecology, 374. One program, affording opportunity for two residents, is offered in occupational medicine. While the number of approved programs increased by less than 4 per cent, the total number of residencies offered increased by approximately 8 per cent during the past year, with 18,669 positions now available in approved programs. This increase is proportionately less than that which occurred last year, when a 14 per cent increase was reported. The marked expansion in facilities for residency training which occurred during the postwar period has slowed according to information presently available.

RESIDENCY VACANCIES

Table 5 includes information on the number of vacancies in approved programs reported as of Sept. 1, 1949. While the total number of positions reported vacant was approximately 6 per cent, 15 per cent or more of the number of positions available were reported vacant in certain specialties. They include physical medicine, with 33 per cent of the residencies in this specialty reported vacant; pulmonary diseases, 21 per cent; psychiatry, 20 per cent, and anesthesiology, 15 per cent. The total number of vacancies reported in these four specialties constitutes 47 per cent of the number of positions which were not filled. The remaining 53 per cent included vacancies in 20 other specialties and subspecialties.

The largest number of vacancies occurred in psychiatry, with 344 positions unfilled; 185 residencies in internal medicine were reported vacant, 107 in anesthesiology and 105 in pathology. Together, these four specialties accounted for 741 of the 1,179 vacancies reported, or 63 per cent. In surgery and the surgical specialties, including neurologic surgery, obstetrics-gynecology, ophthalmology, orthopedic surgery, otolaryngology, plastic surgery, proctology, thoracic surgery and urology, less than 3 per cent of the residencies offered were reported vacant. Of a total number of 8,214 residencies in these specialties, 209 were not filled. Since there was an increase of 1,376 residencies in approved hospitals during the past year, it can be anticipated that there will be an increase in the number of vacancies during the next reporting period.

APPROVED INTERNSHIPS

Council on Medical Education and Hospitals of the American Medical Association

535 North Dearborn Street, Chicago 10

Revised to April 1, 1950

HOSPITALS, 799 INTERNSHIPS, 9,398

The following general hospitals, investigated and approved by the Council on Medical Education and Hospitals, are considered in position to furnish acceptable intern training in accordance with standards adopted by the American Medical Association. Three types of internships are approved by the Council—rotating, mixed and straight:

1. A rotating internship is defined as one which provides supervised experience in internal medicine, surgery, pediatrics, obstetrics and their related subspecialties, together with experience in laboratory and radiologic diagnosis.
2. A mixed internship is defined as one which provides supervised experience in two or more, but not in all, of the clinical divisions named.
3. A straight internship is defined as one which provides supervised experience in a single department, although it may include limited opportunity for work in a related subspecialty. Straight internships are now approved in internal medicine, surgery, pediatrics, obstetrics (with or without gynecology) and pathology.

Hospitals approved for internships that are used by medical schools for undergraduate clinical clerkships on inpatient services have been identified in the following lists by the symbols **X** and **x**. Hospitals have been identified with symbol **X** when a medical school has indicated that the hospital is a major unit in the school's teaching program. Hospitals have been identified with the symbol **x** when a medical school has indicated that the hospital is used to a limited extent in the school's teaching program. Certain internships in hospitals designated as teaching hospitals may not provide for assignments to teaching services. Other internships may provide for only a portion of the internship period being spent on teaching services. Prospective interns desiring specific information concerning internship assignments to teaching services in a hospital are advised to communicate with the dean of the medical school with which the hospital is affiliated. Medical school affiliations are indicated by footnotes 10 to 81 placed immediately after the symbol **X** or **x**. The list of medical schools appears on page 1159. The plus (+) sign indicates additional approval for residencies in specialties, as shown in the Council's list of Approved Residencies and Fellowships.

HOSPITALS APPROVED FOR INTERNSHIPS IN THE DOMINION OF CANADA

For the benefit of graduates of approved medical colleges who desire an internship in Canada, the Council on Medical Education and Hospitals of the American Medical Association has declared that hospitals which conform to the standards of the Canadian Medical Association should be regarded as giving an internship equivalent in educational value to that offered by hospitals in the United States approved for intern training by the Council. It is understood, however, that this statement applies only to hospitals that are unqualifiedly "Approved" under the Canadian plan and does not apply to that group referred to as "Commended."

The following list of hospitals, revised to Jan. 1, 1950, has been furnished by the Canadian Medical Association.

Name of Hospital	Location	Name of Hospital	Location	Name of Hospital	Location
Camp Hill Hospital.....	Halifax, N. S.	Brantford General Hospital....	Brantford, Ont.	Hotel Dieu of St. Joseph.....	Windsor, Ont.
Halifax Infirmary	Halifax, N. S.	Hamilton General Hospital.....	Hamilton, Ont.	Children's Hospital.....	Winnipeg, Man.
Victoria General Hospital.....	Halifax, N. S.	St. Joseph's Hospital.....	Hamilton, Ont.	Deer Lodge Hospital.....	Winnipeg, Man.
St. John General Hospital.....	St. John, N. B.	St. Joseph's Hospital.....	London, Ont.	Misericordia Hospital.....	Winnipeg, Man.
Hospital du St. Sacrement.....	Quebec, Que.	Victoria Hospital.....	London, Ont.	Winnipeg General Hospital.....	Winnipeg, Man.
Hospital Dieu de Quebec.....	Quebec, Que.	Westminster Hospital.....	London, Ont.	St. Boniface Hospital.....	St. Boniface, Man.
Hospital of the Infant Jesus.....	Quebec, Que.	Oshawa General Hospital.....	Oshawa, Ont.	Regina General Hospital.....	Regina, Sask.
Jeffrey Hale's Hospital.....	Quebec, Que.	Ottawa Civic Hospital.....	Ottawa, Ont.	Regina Grey Nun's Hospital.....	Regina, Sask.
Veterans Hospital.....	Quebec, Que.	Ottawa General Hospital.....	Ottawa, Ont.	St. Paul's Hospital.....	Saskatoon, Sask.
Children's Memorial Hospital....	Montreal, Que.	Hotel Dieu Hospital.....	Kingston, Ont.	Saskatoon City Hospital.....	Saskatoon, Sask.
Herbert Reddy Mem. Hospital....	Montreal, Que.	Kingston General Hospital.....	Kingston, Ont.	Calgary General Hospital.....	Calgary, Alta.
Homeopathic Hospital.....	Montreal, Que.	St. Catharines Gen. Hosp.....	St. Catharines, Ont.	Colonel Belcher Hospital.....	Calgary, Alta.
Hospital Notre Dame.....	Montreal, Que.	Christie Street Hospital.....	Toronto, Ont.	Holy Cross Hospital.....	Calgary, Alta.
Hospital Ste. Jeanne d'Arc.....	Montreal, Que.	Hospital for Sick Children.....	Toronto, Ont.	Edmonton General Hospital....	Edmonton, Alta.
Hospital Ste. Justine.....	Montreal, Que.	Mount Sinai Hospital.....	Toronto, Ont.	Misericordia Hospital.....	Edmonton, Alta.
Hotel Dieu de Montreal.....	Montreal, Que.	St. Joseph's Hospital.....	Toronto, Ont.	Royal Alexandra Hospital....	Edmonton, Alta.
Hospital Ste. Luc.....	Montreal, Que.	St. Michael's Hospital.....	Toronto, Ont.	University of Alberta Hosp....	Edmonton, Alta.
Jewish General Hospital.....	Montreal, Que.	Toronto East General Hospital..	Toronto, Ont.	St. Paul's Hospital.....	Vancouver, B. C.
Montreal General Hospital.....	Montreal, Que.	Toronto General Hospital.....	Toronto, Ont.	Shaughnessy Hospital.....	Vancouver, B. C.
Queen Mary Veterans Hospital....	Montreal, Que.	Toronto Western Hospital.....	Toronto, Ont.	Vancouver General Hospital....	Vancouver, B. C.

264. Ingham County T. B. Sanatorium, tuberculosis.
265. Johns Hopkins Hospital, pediatrics.
266. Emergency Hospital, traumatic surgery.
267. Chronic Disease Hospital, chronic diseases; Dunham Hospital, tuberculosis.
268. Arlington and Prince George Hospital, medicine and surgery.

APPROVED RESIDENCIES AND FELLOWSHIPS

Council on Medical Education and Hospitals of the American Medical Association
535 North Dearborn Street, Chicago

Revised to April 1, 1950

Hospitals, 1,079; Assistant Residencies, Residencies and Fellowships, 18,669

The following services are approved by the Council on Medical Education and Hospitals as meeting the requirements of the Essentials of Approved Residencies and Fellowships. In those specialties in which certifying boards have been established approval is extended in concurrence with the Board concerned. The number of years of training for which approval has been granted is indicated in the column, "Length of Approved Program (years)." Residencies in which this designation does not appear have been approved without specifying the number of years for which they are accredited.

The (*) indicates hospitals approved for intern training. The (†) represents temporary approval, pending formal inspection, in accordance with the plan announced in THE JOURNAL, March 2, 1946, p. 586. Granting of approval on this basis has been terminated by action of the Council and the Advisory Board for Medical Specialties. Hospitals temporarily approved prior to this action currently are being inspected to determine whether or not approval should be continued and, if so, the number of years of training for which they will be accredited.

16. OTOLARYNGOLOGY

The following services are approved by the Council and the American Board of Otolaryngology. Residencies in this specialty have been approved without specifying the number of years for which they have been accredited. The Board will give appropriate credit for training in these hospitals on an individual basis.

Hospitals, 152 Assistant Residencies and Residencies, 422

25. RADIOLOGY

The following services are approved by the Council and the American Board of Radiology until July 1, 1951. As previously announced (J. A. M. A. May 14, 1949, p. 211) these services have been reviewed in collaboration with the American Board of Radiology to determine whether approval will be continued and to determine further the number of years of training in individual hospitals which the Board will accept in preparation for its certification examination.

A revised list of approved residencies in Radiology will appear in the Educational Number of the Journal, scheduled for publication in the early fall. Physicians planning to apply for residency training in radiology to begin on or after July 1, 1951 should consult this list in making application for appointment.

Hospitals, 375 Assistant Residencies and Residencies, 970

ANNUAL REPORT ON INTERNSHIPS AND RESIDENCIES

In this issue the Council on Medical Education and Hospitals presents its twenty-fourth Annual Report on Internships and Residencies. The first list of hospitals, approved by the Council on Medical Education and Hospitals for intern training, was published in *THE JOURNAL* in 1914. In early Hospital Numbers of *THE JOURNAL*, general hospitals were listed which offered approved training, and a separate section was devoted to "hospitals for the insane" and "other special hospitals." The latter two groups of hospitals offered approved training in special fields. The original list included 508 approved hospitals which offered positions for 2,667 interns.

The first formal report of the Council on Internships and Residencies was presented in the Hospital Number of *THE JOURNAL* in 1927. In the same issue, for the first time, a separate section was devoted to approved residencies in the specialties, which, for several years thereafter, were referred to as "higher internships." There were 270 hospitals included in the first list, with 1,699 residencies offered in various specialties, including anesthesia, dermatology, obstetrics-gynecology, medicine, neuropsychiatry, ophthalmology, otolaryngology, pathology, pediatrics, radiology, surgery, tuberculosis, urology and general practice. It is of interest that the Council has again set up standards for residencies in general practice, an initial list of hospitals approved in this category appearing in this issue.

The Council's Annual Report and lists of approved hospitals was published each year in the Hospital Number of *THE JOURNAL*, through 1948. In May of that year the Internship and Residency Number appeared as a special issue. It purports to furnish current data regarding hospitals conducting training programs for the guidance of physicians seeking appointments for internships or residencies.

The 1950 report shows there are now 799 hospitals approved by the Council to conduct intern training. They offer a total of 9,398 internships, an increase of 274 over the number available last year. The report points out that there is a trend toward an increased demand for intern service in those hospitals which are approved and cites the disproportionate increase in the number of positions available this year as compared with the total number of hospitals approved. For the first time the Council includes Veterans Administration hospitals in the list of federal services conducting approved intern training. While these hospitals have greatly expanded their residency training programs during the past several years, not until the past year did they also offer internships.

Residencies in general surgery this year are listed under two categories: those approved by the Council in concurrence with the American Board of Surgery and a second group, approved by the Council as offering satisfactory training in preparation for residencies in the surgical specialties.

The Council has announced in a statement prefacing the list of residencies in radiology that a survey of hospitals approved in this specialty has recently been completed by the American Board of Radiology collaborating with the Council. A complete list of approved programs in radiology based on the findings of this survey will appear in the Educational Number of *THE JOURNAL*, scheduled for publication September 9. Pending the publication of this revised list, hospitals are being notified that their present approval will remain in effect until July 1, 1951.

The statistical data in this report are made available through the cooperation of the hospitals included in the approved lists. For their contribution to the report, and for the assistance furnished by the federal services and the medical schools, as well as for the collaboration of the American Boards in evaluating residency training in these hospitals, the Council makes grateful acknowledgment.

APPROVED PROGRAMS IN SURGERY

In the list of Approved Residencies and Fellowships appearing in this issue, hospitals conducting approved training in general surgery are classified under two separate categories: those approved by the Council on Medical Education and Hospitals and the American Board of Surgery and a second group, approved by the Council as offering training in general surgery acceptable in preparation for residencies in the surgical specialties.

This dual listing of residencies in surgery has resulted from the announcement by the American Board of Surgery last June that after July 1, 1950 it would not accept training in hospitals offering residencies of less than three years' duration, unless the program was affiliated with or formed an integral part

of a graded, fully approved residency.¹ In accordance with this announcement, residents qualifying for examination by the American Board of Surgery will be required to complete their training in a single hospital or group of hospitals whose programs have been integrated to assure the resident progressively graded training. An essential consideration in extending approval for three or four years of training in this specialty has been the degree of responsibility afforded the resident for the care and management of patients, including the opportunity for performing major surgical procedures. It is felt that the resident, particularly in the later stages of his training, should assume primary responsibility for operative work, as well as assist qualified surgeons in the performance of operations requiring a high degree of surgical skill and judgment. In the present listing, 451 hospitals have qualified for approval in this category.

There is, however, an appreciable number of hospitals throughout the country offering training in general surgery whose programs for one reason or another do not meet the requirements for approval at the three or four year level. Many of these hospitals have not found it practicable to develop a fully organized three or four year training plan. In some the amount and diversity of clinical material available for teaching precludes their being fully approved. In others the assumption by the resident of primary responsibility for major surgical procedures is not feasible. Within the limitations mentioned, these hospitals offer supervised experience in general surgery which has a place in the training of residents, particularly those qualifying for examination by the surgical specialty boards. Six American boards require one or two years of training in general surgery as a prerequisite to, or as a part of, residency training in their respective fields. In these instances the degree of responsibility given the resident during his training in general surgery is not of primary importance. It is assumed that, during the course of his residency in the specialty itself, the resident will be given adequate opportunity to develop his surgical skill and judgment. A comprehensive orientation to the field of general surgery, including diagnosis, the principles of preoperative and postoperative care and applied instruction in the basic sciences, is of paramount importance.

On this basis, the Council has approved 149 hospitals as offering satisfactory training in general surgery in preparation for residencies in the surgical specialties. It is estimated that about 600 residents will require training of this type annually. The Council is confident that hospitals approved in this category will provide these physicians with training which will give them a sound background for subsequent residencies in their chosen fields.

ROCKY MOUNTAIN SPOTTED FEVER

The chief vectors for the transmission to man of Rocky Mountain spotted fever are the wood tick and the American dog tick. The former is found throughout the Rocky Mountain region and adjacent areas and the latter on the great plains and eastward to the Atlantic coast, to the South reaching into Mexico, and in Canada, eastward from southern Manitoba to Labrador. The wood tick becomes active during the spring and early summer. The dog tick appears in late spring and remains active longer during the summer. In a recent study, Harrell¹ points out that ticks hang from the lower branches of small bushes and shrubs, waving their legs, and thus transfer easily to the hair of passing warm-blooded animals.

Rocky Mountain spotted fever is a severe rickettsial disease, which occurs when a human being is bitten by an infected tick. The rickettsias are found in the blood early in the disease, but they are difficult to culture as they grow only in the presence of living cells. The important endemic foci in the United States are Wyoming, Montana, Colorado and the Southern Atlantic states (Virginia, Maryland and North Carolina). In the West the majority of cases appear between April and June, and in the East, during July and August. Throughout the United States more cases occur during July than in any other month. In the East, the vector is the common dog tick. Many cases occur in persons seeking recreation and on vacation in rural or suburban areas. Protection against infection lies in preventing the attachment of a tick to the skin. High boots, leggings or socks worn outside the trousers hinder the tick from attaching itself to the leg, but, if there are no openings there in the clothing, the tick will crawl up and attach itself on the neck. In tick-infested country one should pass the hand frequently over the back of the neck and behind the ears to remove ticks that may not be as yet attached to the skin. After becoming attached ticks seldom transfer the infection until they have fed on the victim for several hours. Therefore, inspection of the body and clothing twice daily when in infested country is usually sufficient. A tick attached to the skin should be removed immediately as gently as possible to prevent squeezing the feces out of the insect and on the skin. If the tick is pulled off with the finger, it should be handled with a small piece of paper and the abrasion gently touched with a disinfectant, such as iodine or a mercurial antiseptic, or gently washed with soap and water.

There are vaccines which have definite protective value for a period of less than a year. Before the vaccine is injected under the skin or into the muscle in allergic persons, an intradermal test should be made to determine sensitivity to the vaccine. Tourists who go to endemic areas and persons who live in areas where

1. J. A.M. A. 141:86 (Sept. 3) 1949.

1. Harrell, G. T.: Rocky Mountain Spotted Fever, *Medicine* 28:333 (Dec.) 1949.

the strain of *Rickettsia* is highly virulent should be vaccinated.

No test is available which will quickly establish a diagnosis early in the course of the disease. The agglutination test, the most widely used confirmatory diagnostic procedure, does not differentiate the various rickettsial infections. The complement fixation test is specific for the spotted fever strain of rickettsias, but it is technically difficult and the results are dependable only in experienced hands.

The mortality of Rocky Mountain spotted fever throughout the United States averaged 23 per cent in 4,033 cases reported during the period 1939-1946. Fortunately, two of the newer antibiotics, aureomycin and chloramphenicol, give promise of being effective in the treatment of Rocky Mountain spotted fever.

Rickettsial diseases of man related to spotted fever and transmitted by ticks occur throughout the world. A disease called São Paulo typhus in South America apparently is identical with Rocky Mountain spotted fever of North America. Kenya fever in Africa apparently is related to Rocky Mountain spotted fever. Marseille fever and escarro-nodulaire in Mediterranean countries differ only in that in these a primary site of inoculation is evidenced by an ulcer. In other parts of the world, Russia, India and North Queensland, tick-borne rickettsioses are often called tick typhus. All these strains of rickettsias appear to be immunologically related. Wilder² recently reviewed the work of Howard Ricketts and his associates, who made fundamental contributions to the knowledge of the rickettsial diseases.

READING DISABILITIES IN CHILDREN

There is a group of children, estimated by Monroe to amount to about 12 per cent of all children in the United States, who fail to learn to read as well as the average of their class. These children have normal or better than normal intelligence and normal social and vocabulary development. Most of these children have normal vision. Occasionally one encounters dyslexia associated with left handedness, particularly when attempts had been made to convert left handedness to right handedness. The disability manifests itself in a variety of ways, such as confusion of one consonant with another, as *b* for *d*, *p* for *q* and *t* for *f*, or a reversal of syllables, words or entire sentences, as in mirror writing, or complete failure to recognize a word. Criticism by the teacher and parents makes the child lose confidence in his ability to do school work and leads to the development of various emotional problems, with psychologic blocks which further aggravate the condition.

The etiology of the developmental *dyslexia* is not clearly understood. It is doubtful that there is in

these children any underlying organic lesion, such as the agenesis of the dominant angular gyrus. The absence of any other evidence of intracranial damage speaks against this hypothesis. Emotional factors such as fear, anxiety, rivalry, jealousy, hostility for the parent or the teacher and a feeling of inferiority undoubtedly play an important role in creating these difficulties. It is significant that many of the complexes associated with the reading disability disappear with improvement in reading.

Crisp¹ and Rychener² believe with Orton that the new method of teaching reading, the so-called "flash" method, is an important contributory factor in the creation of these disabilities. The "flash" method employs whole words on cards with pictorial representation to develop pure visual associations. The method was expanded into a phrase and later into a sentence method. The child on entering school immediately learns to read whole sentences. The analysis of the sentence into individual words and the analysis of individual words into phonic sounds are taught secondarily, when the child already has an extensive reading vocabulary based on visual memory rather than on synthesis of words. Berner and Berner³ point out that, while this method produces rapid and intelligent readers, it tends to the limit the child's power of attention and concentration. These authors feel that certain minor difficulties such as low hypermetropia and deficient fusion, which were of minor importance under the older methods of teaching, have now become significant.

Crisp, Rychener and Orton believe that a small percentage of children need phonetic training. According to Orton among children who had been taught by the "flash" method there were three times as many cases of reading difficulties as among those who had been taught by the phonetic method. Crisp feels that emphasis on speed rather than on accuracy in the development of a new skill, such as reading, must increase the subconscious sense of defeat and conflict in a child's mind, to be followed by failure in further efforts.

The important elements in the treatment of these disabilities are their earliest recognition and sympathetic handling of the problem. Training in phonetics, remedial reading and the employment of every means to restore the child's confidence in his ability to read make for favorable prognosis. The advantages of the older, the phonetic method, as contrasted with the new, the "flash" method, particularly as related to developmental dyslexia, is a problem to be solved by the cooperation of the ophthalmologist and the pedagog.

The complexity of the problem of dyslexia, involving endocrine imbalances, dietetic errors, occasionally ocular difficulties and psychologic problems, such as the emotional reaction of the child toward the teacher and the parent, makes it evident that supplementary tutoring by a parent or teacher will seldom accomplish the goal. Dyslexia in all its phases is best treated in special institutions staffed by specialists in various fields and devoted to the study and treatment of the various reading disabilities. The Reading Difficulty Center of Columbus, Ohio, the Memphis Orthoptic Center or the Dyslexia Memorial Institute in Chicago⁴ are some of the institutions engaged in this work.

Current Comment

RESIDENCIES IN GENERAL PRACTICE

In December 1948, the Council adopted standards for approval of residencies in general practice. Hospitals which were approved under the general residency classification were advised that they would be expected to organize their training program in accordance with the new requirements if they wished to retain their approved status. In this issue the Council lists 32 hospitals which have developed acceptable programs based on the requirements outlined in the Essentials of Approved Residencies and Fellowships. A number of these residencies are offered in teaching hospitals under the aegis of a medical school. That these schools have taken the leadership in sponsoring programs in general practice at the graduate training level is most encouraging. A hospital requesting approval for residency training in general practice must meet the same general requirements as does a hospital offering residency training in a specialty. These residencies provide for supervised training in the major clinical divisions of internal medicine, surgery, obstetrics-gynecology and pediatrics and in the special services of anesthesiology, radiology and pathology. The programs which have been approved, while varying in the scope and extent of the training provided, are designed specifically to meet the needs of the young physician intending to enter general practice. Several of these hospitals have already notified the Council that they have had many more applications for the positions available than they have been able to accept. While complete statistics are not available, it seems probable that a greater proportion of medical school graduates are planning to enter general practice than has been true for the past several years. It is felt that this trend will be stimulated by the development of residencies of the type and quality of those presently approved. On completing residencies of this nature, the young doctor can begin his practice with the assurance that he has had advanced training comparable to that of his colleagues who finish residencies in the specialties.

APPROVED RESIDENCIES

The number of residencies approved by the Council on Medical Education and Hospitals, as reported in this issue, has risen to a total of 18,669, an increase of 8 per cent over the number approved last year. Significant increases in the number of residencies offered were reported in the following divisions: anesthesiology, internal medicine, neurologic surgery, neurology, obstetrics-gynecology, pediatrics, psychiatry and radiology. It is evident that a point has been reached in the residency field where the number of positions available in approved hospitals will exceed appreciably the number of potential applicants. The greatly increased demand for residency training which existed in the postwar period has been largely met. In the next few years candidates for appointment to residency positions will be drawn primarily from interns completing their service. It is apparent that there will not be a sufficient number of interns available to fill all positions offered. Further, an increasing proportion of medical school graduates have indicated their interest in general practice rather than in training and, later, practice in a specialty. Hospitals which have organized their house staff on the basis of an expanding residency program may well consider, at this time, the fact that a reduction in the number of residency applicants can be anticipated. The Council's report points out that there were 1,179 positions in approved residency programs reported vacant last year. With a decrease in the number of physicians seeking residency training probable, the problem of meeting the hospitals' demand for residents will require careful consideration.

NEW REMEDIES FOR RHEUMATOID ARTHRITIS

Rapid and dramatic remission of signs and symptoms of rheumatoid arthritis by cortisone and the adrenocorticotrophic hormone, ACTH, has given the medical profession a new standard of comparison for evaluation of therapeutic agents in this disease. Because of the scarcity of these hormones, it was inevitable that certain substitutes should be advocated as "nearly as good." Thus, recent months have seen claims advanced for pregnenolone, epinephrine, combinations of testosterone, estrogen and pregnenolone, and desoxycorticosterone acetate with ascorbic acid. Many of these claims have been attended by flurries of favorable publicity in the lay press, which resulted in considerable pressure from the public for the use of these products by practicing physicians. This situation is unfortunate, for none of these products has produced results comparable with those obtained with cortisone and the adrenocorticotrophic hormone. Some of the newer remedies and technics offer interesting possibilities for further study, but none is beyond the stage of experimental investigation. Until additional convincing data are forthcoming, the medical profession must advise its patients that the remedies recently proposed for arthritis cannot be placed in general use. In fact, some of the proposals eventually may be proved unsatisfactory for even restricted use.
